

Product CSV review

SYNTHETIC DEMONSTRATION - NOT CLIENT WORK

Example findings produced by the local CSV audit tool. This sample shows the scope and wording of a partial preflight report; it does not demonstrate client results or guarantee a successful Shopify import.

3 data records reviewed / 3 errors flagged / 2 review warnings

Mode: creating new products. Record numbers include the header as record 1; they are CSV records, not necessarily physical text lines.

Record / field	Level	Finding
3 / Price	Error	Use a nonnegative decimal amount without currency symbols, spaces, or thousands separators.
3 / SKU	Warning	SKU repeats record 2. This is a review item, not necessarily an import error.
4 / URL handle	Error	Handle contains whitespace. Do not change an existing handle without checking product identity.
4 / Status	Error	Expected active, draft, or archived.
4 / Product image URL	Warning	Review image URL: expected a public HTTP(S) URL without credentials. Availability is not checked.

How to use these findings

Review the price format and status value. Investigate the handle before changing product identity. Review the repeated SKU in context, and check the image URL separately. Make any corrections in a copy of the source file, then rerun the checks.

What this report does not do

No source edits, store login or live import. No image availability checks, inventory reconciliation, or full custom app/metafield validation. Shopify and connected apps may enforce additional requirements. A report without flagged issues is not a certification.
